Special topics in econometrics / Sujets spéciaux d'économétrie
Fall / Automne 2017
Course outline / Syllabus
Preliminary / Préliminaire

Professor / Professeur : Jean-Marie Dufour

September - December 2017 / Septembre - décembre 2017
Version: September 4, 2017

This course has two main objectives

1. The first one is to review basic statistical and econometric theory at an advanced level, especially (but not exclusively) in view of developing tests and confidence sets in econometrics.
2. The second objective consists in studying a number of special topics of interest for advanced work and research. Methods allowing one to obtain finite-sample inference procedures as well more reliable large-sample methods will be emphasized. Among the topics considered, the following ones will get special attenbtion:
   (a) statistical inference methods based on simulation (Monte Carlo tests, bootstrapping);
   (b) finite-sample nonparametric methods;
   (c) projection techniques for the construction of tests and confidence sets;
   (d) identification, testability, exogeneity and weak instrument problems in structural modelling (Highlight theme for 2016-2017);
   (e) causality analysis in econometrics (Highlight theme for 2016-2017).

A more detailed lists of topics is available at the end of this syllabus.
A list of papers related to the Highlight themes will be supplied later.
The course should be especially useful to students who wish to prepare the a comprehensive Ph.D. examination in Econometrics and eventually write a dissertation where Econometrics plays an important role.

Ce cours comporte deux objectifs principaux. Le premier consiste à étudier certains éléments de théorie statistique qui sont importants pour le développement de tests et régions de confiance en économétrie. Le second sera d'étudier et appliquer dans différents contextes diverses méthodes qui permettent d'obtenir des procédures d'inférence valides dans les échantillons finis ou encore des procédures asymptotiques plus fiables. Parmi les sujets qui recevront une attention particulière, on notera: les techniques de test fondées sur le recours à des simulations (tests de Monte Carlo, bootstrap), l'emploi de techniques de projection pour la construction de tests et régions de confiance, les problèmes d'instruments faibles en économétrie structurelle, ainsi que diverses techniques non-paramétriques exactes.

Documents and other material relevant to the course will be available from my homepage:

`http://www.jeanmariedufour.com`
`http://www.jeanmariedufour.org`

_

- **Lecture hours**: Monday, 18:05 - 20:55.
- Beginning: Monday, September 11, 2017. End: Thursday, December 7, 2017.
- Exams end on Thursday, December 21, 2017.
- **Room**: Leacock 424.
- **Office hours**: by appointment.
- **e-mail**: `jean-marie.dufour@mcgill.ca`

The evaluation will be based on three elements (percentage refer to the entire year's grade):

1. a mid-term exam: 20% of the grade;
2. problem sets: 20% of the grade;
3. short paper and presentation where a recent publised paper on one of the Highlight topic: 20% of the grade;
4. a final exam: 40% of the grade.

L'évaluation sera basée sur deux éléments:

1. un examen intra-semestriel: 20% de la note;
2. exercices: 20% de la note;
3. court texte et présentation sur un article reliés à un des thèmes spéciaux choisi pour 2016-2017: 20% de la note;
4. examen final: 40% de la note.

In accord with McGill University's Charter of Students' Rights, students in this course have the right to submit in English or in French any written work that is to be graded.

Official statements:

McGill University values academic integrity. Therefore all students must understand the meaning and consequences of cheating, plagiarism and other academic offences under the Code of Student Conduct and Disciplinary Procedures (see www.mcgill.ca/students/srr/honest/ for more information).
According to Senate regulations, instructors are not permitted to make special arrangements for final exams. Please consult the calendar, section 4.7.2.1, General University Information and Regulations, at www.mcgill.ca .

L'université McGill attache une haute importance à l'honnêteté académique. Il incombe par conséquent à tous les étudiants de comprendre ce que l'on entend par tricherie, plagiat et autres infractions académiques, ainsi que les conséquences que peuvent avoir de telles actions, selon le Code de conduite de l'étudiant et des procédures disciplinaires (pour de plus amples renseignements, veuillez consulter le site www.mcgill.ca/students/srr/honest/).

Homework schedule

Week	Day	Monday (18:05-20:55)	Exercise set to hand in	
1	Monday	11 September 2017		
2	Monday	18 September 2017	Exercises 1: Models	
3	Monday	25 September 2017	Exercises 2: Decision Theory. Exercises 3: Information	
4	Monday	2 October 2017	Exercises 4: Estimation theory	
5	Monday	9 October 2017	Exercises 5: Unbiased estimation	
6	Monday	16 October 2017	Exercises 6: General issues in testing theory	
7	Monday	23 October 2017	Exercises 7: Unbiased and invariant tests	Mid-term exam
8	Monday	30 October 2017	Exercises 8: Confidence sets	
9	Monday	6 November 2017	Exercises 9-10: Maximum likelihood method (estimation and tests)	
10	Monday	13 November 2017	Exercises 11: M-estimators	
11	Monday	20 November 2017	Exercises 12: Methods of moments	
12	Monday	27 November 2017	Exercises 13: Equality constraints	
13	Monday	4 December 2017	Exercises 14: Prediction and residuals	
14	Thursday	8 December 2017	Exercises 15: General asymptotic tests	
14	Friday	9 December 2017		Final exam

Topics

The course of this year will focus on the following topics

1. General statistical and econometric theory
    (a) Statistical models
    (b) Statistical problems
2. Testing and confidence set theory
3. Identification and testability
4. Approaches to inference
    (a) Finite-sample inference
    (b) Asymptotic inference
5. Quantiles, Lorenz curves and inequality
    (a) Distribution function functions and quantiles
    (b) Lorenz curves
    (c) Inequality measures
6. Special topics in inference
    (a) Simulation-based methods
        i. Monte Carlo tests
        ii. Boostrapping
    (b) Methods for dealing with nuisance parameters
        i. Bounds methods
        ii. Two-stage confidence procedures
    (c) $C(\alpha)$ tests
7. Causality
    (a) General theories of causality
    (b) Causality in statistical models
    (c) Causality in static statistical models
    (d) Direct, indirect and total effects

(e) Treatment effects and policy analysis

(f) Causality in time series

   i. Wiener-Granger causality

   ii. Multiple horizon causality

(g) Causality in macroeconomics

Detailed topics

A. General econometric theory

1. Philosophy of science and statistics

1. Objectives of scientific knowledge
2. Criteria for evaluating theories and models

2. Inference techniques

1. Statistical models
   (a) Notion of statistical model
   (b) Important econometric models
2. Statistical problems
   (a) Statistical problems as decision problems
   (b) Review of important statistical problems
      i. Estimation
      ii. Tests
      iii. Confidence regions
      iv. Multiple tests and simultaneous inference
      v. Prediction
      vi. Model selection
3. Information and identification
   (a) Sufficient and ancillary statistics
   (b) Information
   (c) Identification
4. Estimation
   (a) Criteria for evaluating estimators

(b) Unbiased estimation

(c) Some general estimation methods

i. Maximum likelihood
ii. M-estimators
iii. Instrumental variables
iv. Methods of moments
v. Minimum distance

5. Testing

(a) Basic concepts: level, size, power, conservative test, liberal test

(b) Optimal tests and Neyman-Pearson theorem

(c) Important classes of tests

i. Similar tests
ii. Unbiased tests
iii. Invariant tests

(d) Some general methods for building tests

i. Likelihood ratio
ii. Wald tests
iii. Score-based procedures [Rao, Lagrange multiplier, Neyman's $C(\alpha)$]
iv. Union-intersection methods

6. Confidence regions

(a) Basic concepts

(b) Pivotal functions

(c) Duality between tests and confidence regions

7. Multiple tests and simultaneous inference

8. Prediction and residuals

9. Model selection

10. Bayesian approach

3. Distributional problems and finite-sample analysis

1. Asymptotic theory and its limitations
    (a) Review of basic asymptotic notions and results
    (b) Asymptotic expansions
    (c) Limitations of asymptotic theory
2. Invariance problems in nonlinear models
3. Techniques for building finite-sample inference procedures
    (a) Analytical derivation of distributions
        i. Exact distributions of quadratic forms in Gaussian variables
        ii. Imhof's algorithm
    (b) Elimination of nuisance parameters
        i. Conditioning
        ii. Transformations
    (c) Bounds
    (d) Projection
    (e) Randomization
4. Theory of Monte Carlo tests
5. Bootstrap

4. Static and dynamic regressions

1. Nonregular problems in classical linear regressions
    (a) Linear models with non-normal disturbances
    (b) Confidence intervals for ratios of coefficients, Fieller's method
    (c) Linear models with exact collinearity
    (d) Tests of nonlinear hypotheses
    (e) Nonlinear restrictions
    (f) Tests of multiple hypotheses
2. Specification tests and analysis of residuals
    (a) Normality of errors

   (b) Heteroskedasticity
   (c) Autocorrelation
   (d) Outliers
3. Linear regressions with autocorrelated errors
4. Multiple equation regression models
   (a) Multivariate linear regressions (MLR)
   (b) Seemingly unrelated regressions (SURE)
5. Regressions with heteroskedastic errors
6. Inference problems in dynamic models
   (a) Review of technical difficulties
   (b) Exact inference in dynamic models
7. Structural change analysis
8. Nonlinear regressions

5. Identification and structural models

1. Simultaneous equations and identification
2. Inference problems associated with identification.
   (a) Impossibility theorems
   (b) Weak instruments
3. Exact inference in structural models
4. Methods adapted to weak instruments
5. Nonlinear structural models
6. Generalized method of moments

6. Causality and multivariate time series models

1. Multivariate time series models
2. General notions on causality in econometrics
3. Causality in multivariate time series models

7. Nonparametric methods

1. Signs, ranks and permutations
2. Location tests
3. Tests against serial dependence
4. Conditional independence tests
5. Goodness-of-fit tests

8. Philosophie des sciences et statistique

1. Objectifs de la connaissance scientifique
2. Critères servant à évaluer les théories et les modèles

9. Techniques d'inférence

1. Modèles statistiques
   (a) La notion de modèles statistique
   (b) Quelques modèles économétriques importants
2. Problèmes statistiques
   (a) Les problèmes statistiques comme problèmes de décision
   (b) Revue des principaux problèmes statistiques
      i. Estimation
      ii. Tests
      iii. Régions de confiance
      iv. Tests multiples et inférence simultanée
      v. Prévision
      vi. Choix de modèles
3. Information et identification
   (a) Notions de statistique exhaustive et de statistique libre
   (b) Information
   (c) Identification
4. Estimation
   (a) Critères pour les estimateurs
   (b) Estimation sans biais
   (c) Quelques méthodes générales d'estimation
      i. Maximum de vraisemblance
      ii. M-estimateurs

iii. Variables instrumentales
iv. Méthodes de moments
v. Distance minimale

5. Tests

   (a) Concepts de base: niveau, taille, puissance, tests conservateurs, tests libéraux
   (b) Tests optimaux et théorème de Neyman-Pearson
   (c) Classes importantes de tests
      i. Tests α-semblables
      ii. Tests sans biais
      iii. Tests invariants
   (d) Quelques méthodes générales pour construire des tests
      i. Quotient de vraisemblance
      ii. Tests de Wald
      iii. Tests fondés sur la vraisemblance [Rao, multiplicateur de Lagrange, $C(\alpha)$ de Neyman]
      iv. Méthodes d'union-intersection

6. Régions de confiance

   (a) Concepts de base
   (b) Notion de fonction pivotale
   (c) Dualité entre tests et régions de confiance

7. Tests multiples et inférence simultanée
8. Prévision et résidus
9. Choix de modèles
10. Approche bayésienne

10. Problèmes distributionnels et analyse à distance finie

1. La théorie asymptotique et ses limitations

   (a) Rappels de théorie asymptotique
   (b) Expansions asymptotiques
   (c) Limitations de la théorie asymptotique

2. Problèmes d'invariance de tests dans les modèles non linéaires
3. Techniques pour la mise au point de procédures d'inférence à distance finie
   (a) Dérivation de distributions analytiques exactes
      i. Distributions exactes de formes quadratiques dans le cas gaussien
      ii. Algorithme d'Imhof
   (b) Élimination des paramètres du nuisance
      i. Conditionnement
      ii. Transformations
   (c) Bornes
   (d) Projection
   (e) Randomisation
4. Théorie des tests de Monte Carlo
5. Bootstrap

11. Modèles de régression statiques et dynamiques

1. Problèmes non réguliers dans le modèle linéaire classique
   (a) Modèles linéaires avec erreurs non-normales
   (b) Intervalles de confiance pour des ratios de coefficients, méthode de Fieller
   (c) Modèles linéaires avec collinéarité exacte
   (d) Tests d'hypothèses non linéaires
   (e) Contraintes non-linéaires
   (f) Tests d'hypothèses multiples
2. Tests de spécification et analyse de résidus
   (a) Normalité des erreurs
   (b) Hétéroscédasticité
   (c) Autocorrélation
   (d) Observations à l'écart
3. Modèles de régression avec erreurs autocorrélées
4. Modèles de régression à plusieurs équations

   (a) Modèles de régression multivariés (MLR)
   (b) Régressions empilées (SURE)
   (c) Applications à des modèles d'évaluation de prix d'actifs financiers (CAPM)

5. Régressions avec erreurs hétéroscédastiques
6. Problèmes d'inférence dans les modèles dynamiques

   (a) Revue des difficultés techniques
   (b) Inférence exacte dans les modèles dynamiques

7. Problèmes d'analyse du changement structurel
8. Modèles de régression non-linéaires

12. Modèles structurels

1. Équations simultanées linéaires et identification
2. Problèmes d'inférence reliés à l'identification.

   (a) Théorèmes d'impossibilité
   (b) Instruments faibles

3. Inférence exacte dans les modèles structurels
4. Méthodes d'inférence adaptées aux instruments faibles
5. Modèles structurels non linéaires
6. Méthode des moments généralisés

13. Causalité et modèles de séries chronologiques multivariés

1. Modèles de séries chronologiques multivariés
2. Généralités sur la causalité en économétrie
3. Causalité dans les modèles de séries chronologiques multivariés

14. Méthodes non-paramétriques

1. Généralités sur les tests de signes, de rangs et de permutations
2. Tests de localisation
3. Tests contre la dépendance sérielle
4. Tests d’orthogonalité
5. Tests d’ajustement

Readings and main references / Lectures et références principales

The symbol * represents required readings. Topics for which no reference is provided will covered in class-notes. Photocopied lecture notes also constitute required reading.

Le symbole * représente des lectures obligatoires. Les sujets pour lesquels aucune référence n'apparaît seront couverts au moyen de notes de cours. Les notes de cours photocopiées constituent des lectures obligatoires.
