ECON 257 EXERCISES 5

Classical linear model: Specification errors Review questions

Consider a $T \times 1$ vector of observations y such that

$$y = X\beta + \varepsilon \tag{1}$$

where all the assumptions the classical linear model are satisfied.

1. Suppose that

$$y = X\beta + \varepsilon = X_1\beta_1 + x_k\beta_k + \varepsilon \tag{2}$$

where X_1 is a $T \times (k-1)$ fixed matrix and x_k is a $T \times 1$ fixed vector. Instead of (2), we estimate the incomplete model:

$$y = X_1 \gamma + \varepsilon. \tag{3}$$

Discuss the properties of the least squares estimator $\hat{\gamma}$ based on the incomplete model (3) as an estimator of β_1 .

- (a) Find the expected value of $\hat{\gamma}$.
- (b) Is $\hat{\gamma}$ an unbiased estimator of β_1 ?
- (c) If $\hat{\gamma}$ is not an unbiased estimator of β_1 , give a condition under which it would be unbiased.
- (d) Find the covariance matrix of $\hat{\gamma}$. Is it larger or smaller than the covariance matrix of $\hat{\beta}_1$ based on the complete model (2)?
- (e) Discuss the properties of the estimator of σ^2 based on the incomplete model (3).
- 2. Discuss the consequence of having

$$\mathsf{E}(\varepsilon) = \xi \neq 0 \tag{4}$$

on the properties of the least squares estimator of β in (1).

3. In model (1), suppose that

$$\mathsf{E}\big(\varepsilon\varepsilon'\big) = \Omega \,. \tag{5}$$

where Ω is known positive definite matrix.

- (a) Is the least squares estimator $\hat{\beta}$ unbiased ?
- (b) Find the covariance matrix $V(\hat{\beta})$.
- (c) Discuss the consequences of the above observations on testing the hypothesis $\beta_1=0$.
- (d) Propose a best linear unbiased estimator of β .
